

ANALYZING THEMATIC ALIGNMENT IN DRUG SAFETY

Do published articles really match what a journal says it publishes?

NLP - Exam Project
Greta Zehnder (53026A)

- EVERY JOURNAL DECLARES AN **AIMS & SCOPE**
- EDITORIAL FOCUS CAN **DRIFT OVER TIME**
- READING EVERYTHING BY HAND DOESN'T SCALE

RESEARCH QUESTION

To what extent are the articles published in *Drug Safety* thematically aligned with the journal's stated Aims & Scope, and how has this alignment evolved between 2015 and 2025?

THE DATASET

DRUG SAFETY

Scientific journal

PUBMED

Domain

1,074

Valid articles

2015–2025

Year range

EDA & PREPROCESSING:

- **Year 2026**
- **“Duplicate” title**
- **Correction notices**
- **Text preprocessing**

Only 39 articles vs. 89–115 for a complete year → **excluded** as incomplete

Investigated: two distinct correction notices, **not a real duplicate**

16 short **“Correction to:”** notices **removed** (not real research abstracts)

Whitespace **normalized**; wording and casing **preserved**

TURNING TEXT INTO VECTORS

01 CHUNKING

The problem: **abstracts are too long**

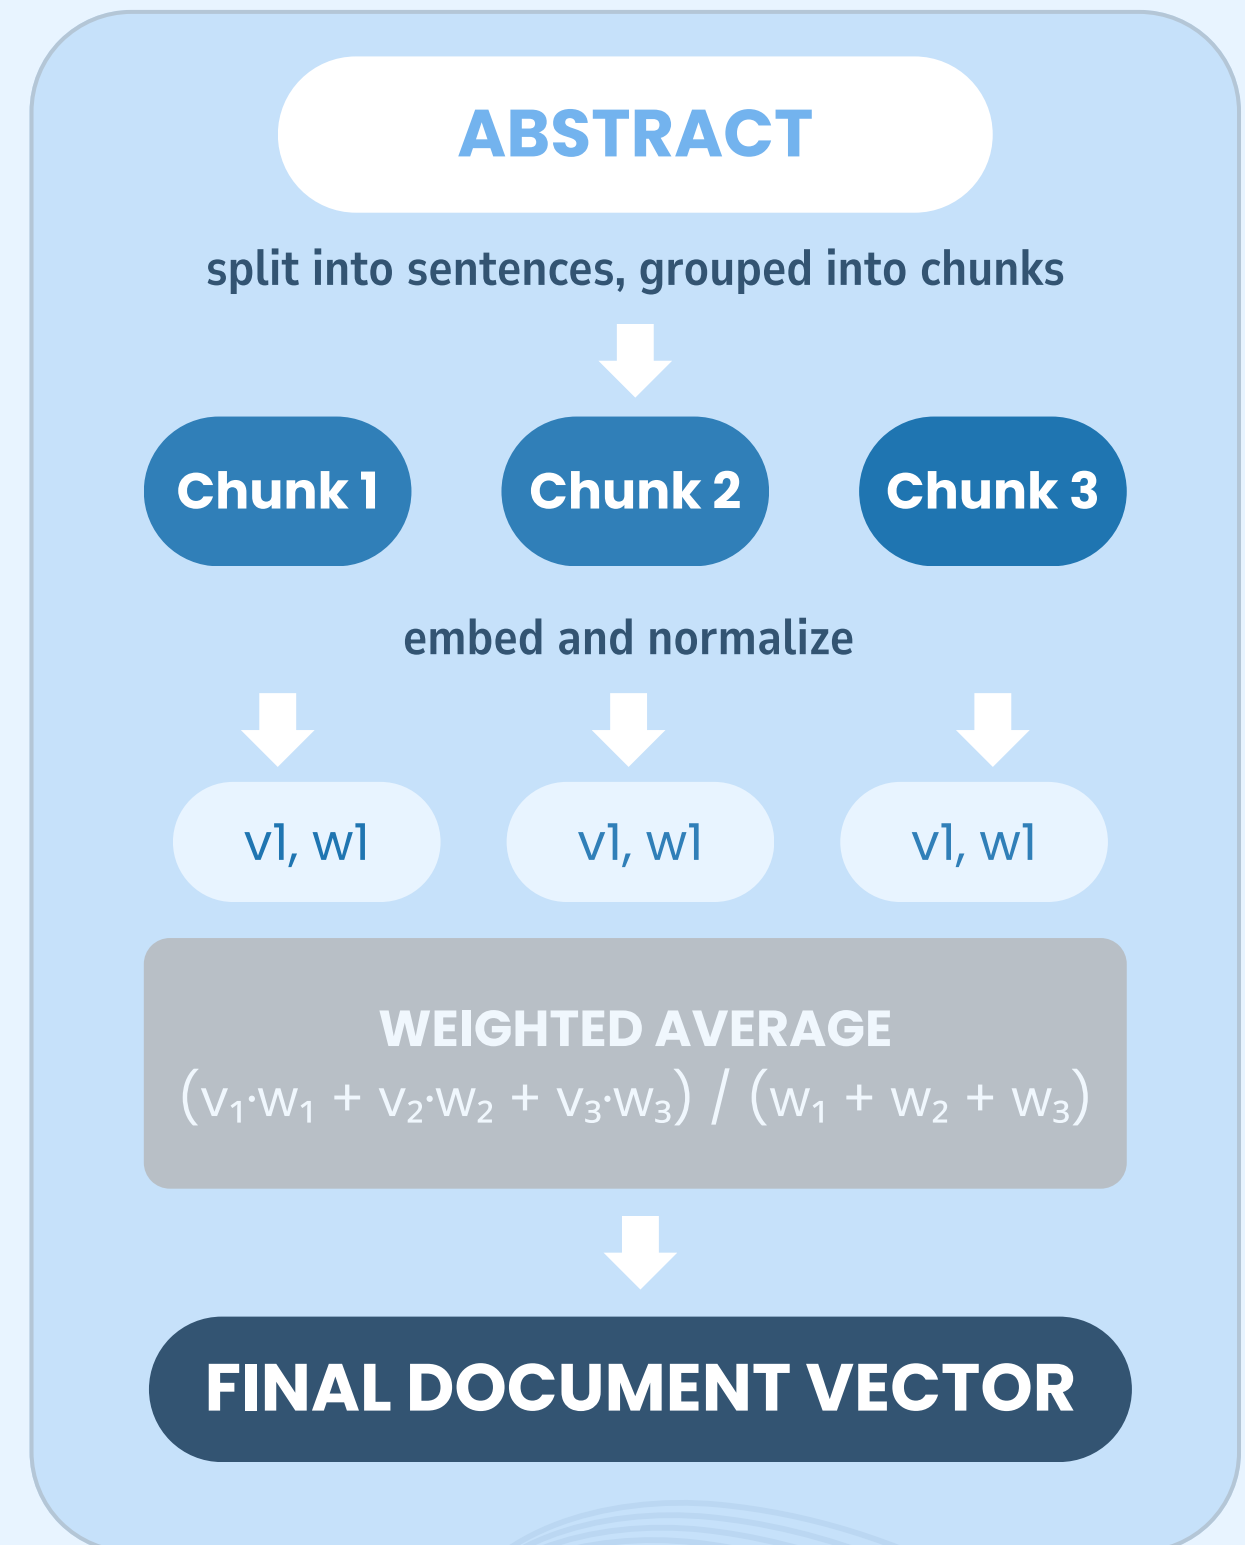

91.05% of abstracts exceed the 256-token limit

92.3% of the final corpus needed more than 1 chunk

Our solution: **sentence-based chunking**

02 EMBEDDING

SentenceTransformer: all-MiniLM-L6-v2

ALIGNMENT SCORE AND OUTLIERS

Alignment score

$$\text{Alignment}(i) = \cos(v_i, v_s) = \frac{v_i \cdot v_s}{\|v_i\| \|v_s\|}$$

cosine similarity between each abstract's vector and the Aims & Scope vector

Outlier detection: z-score, threshold 2.0

$$z_i = \left| \frac{\text{Alignment}(i) - \mu}{\sigma} \right| > 2.0$$

49 outliers found:

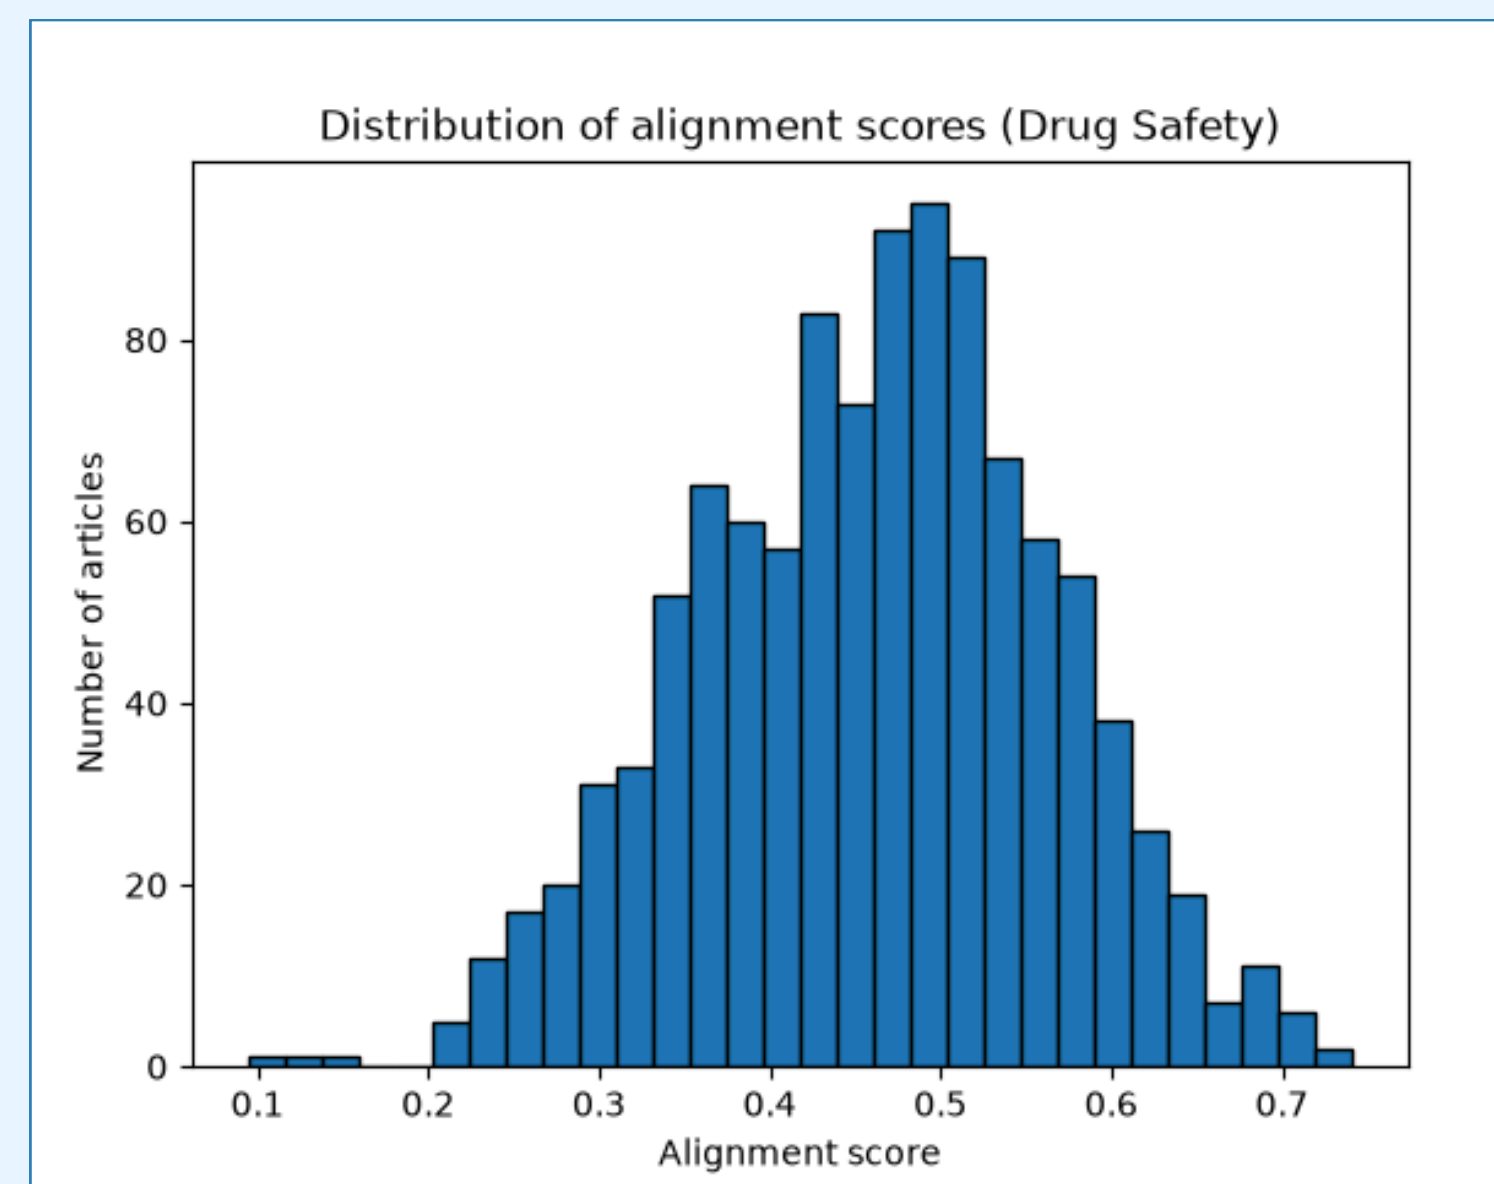

- Low-alignment outliers: 28
- High-alignment outliers: 21

0.461

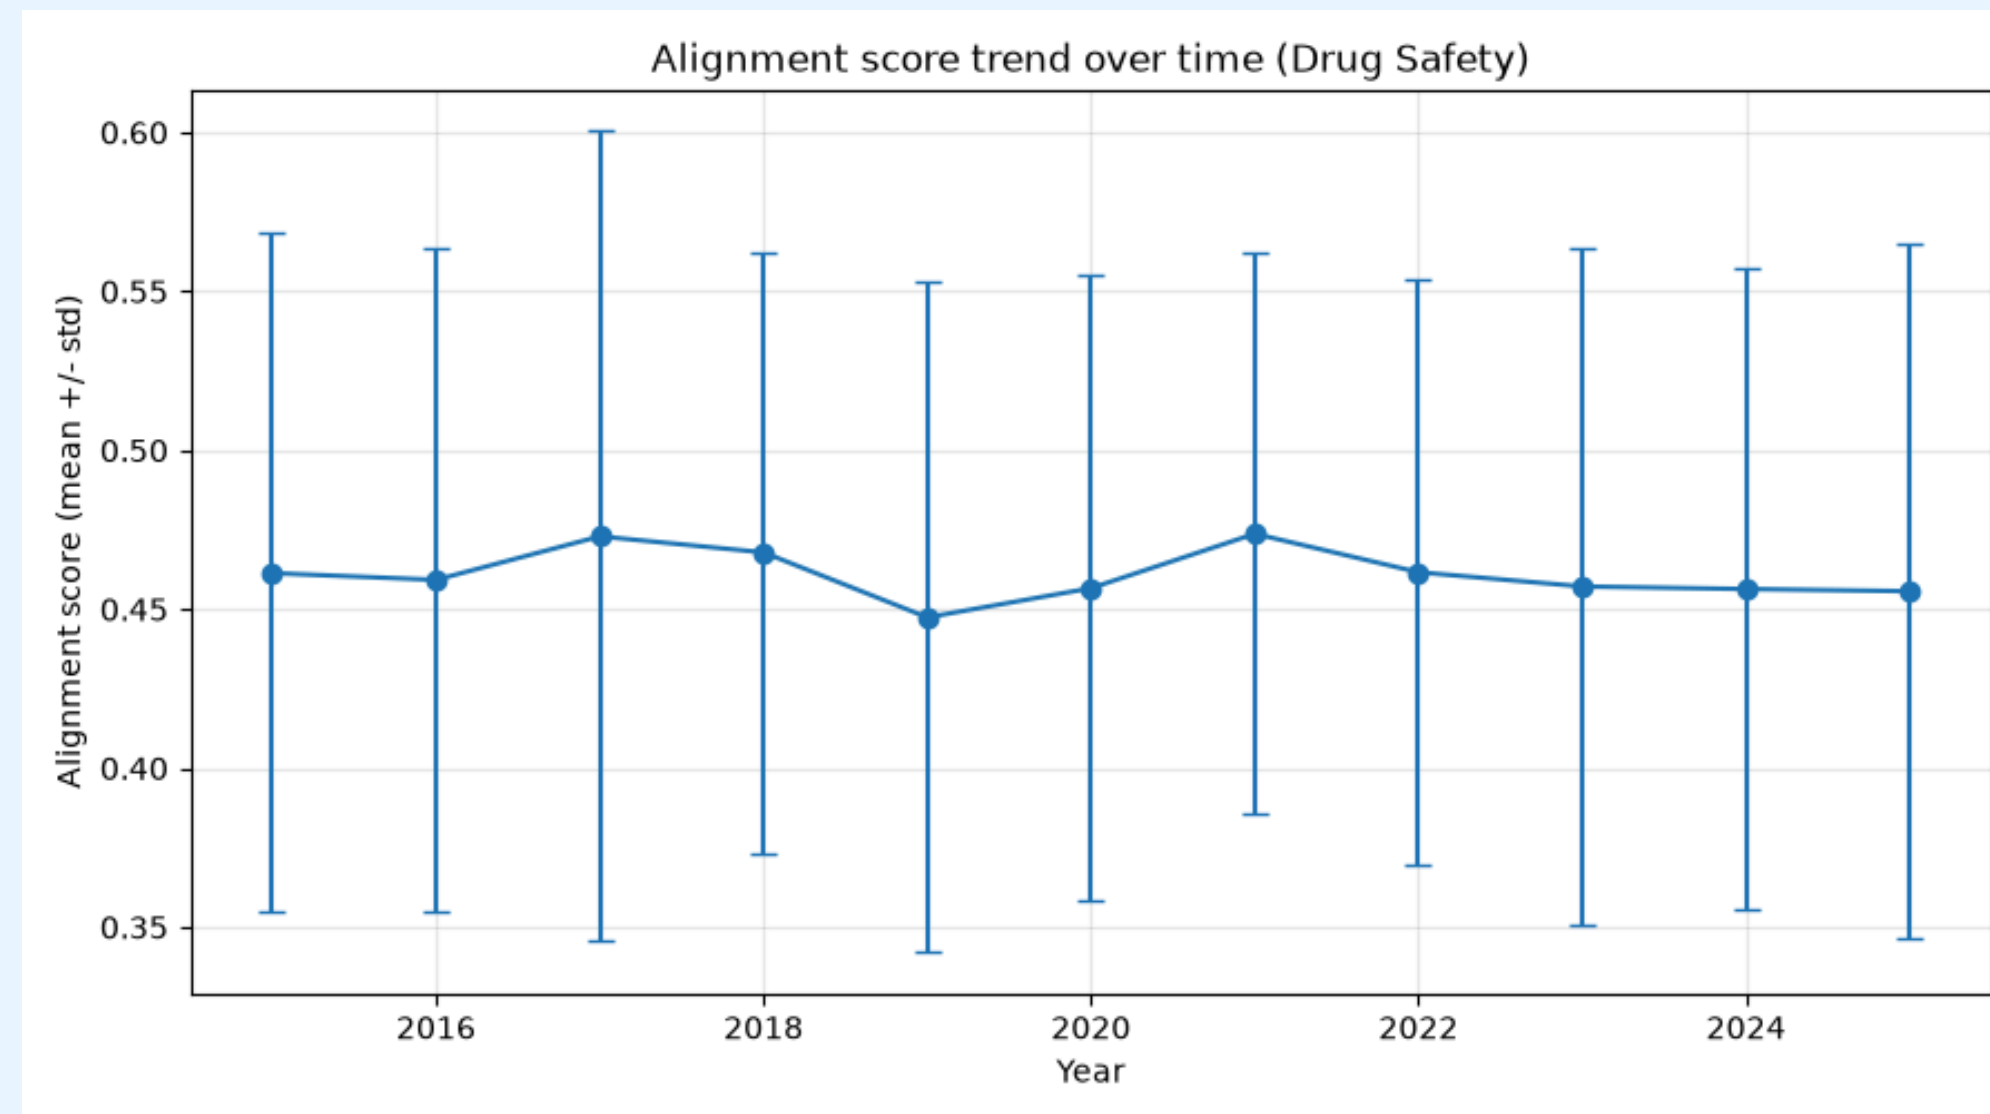

Mean score

0.104

Std. dev.

THEMATIC DRIFT

A stable picture, on average

No systematic drift in the yearly average: stays within 0.45–0.47 across the whole decade.

But does that mean nothing changed underneath?

MODEL CHOICE VALIDATION

Why Sentence-BERT and not raw BERT?

Sentence-BERT provides more discriminative similarity scores

Sentence-BERT

Mean 0.461

SD 0.100

Semantic-similarity optimized

Naive BERT

Mean 0.841

SD 0.025

Raw mean pooling

Naive BERT compresses scores into a narrow high-similarity range,
while Sentence-BERT better separates articles by semantic alignment.

READING THE EXTREMES

HIGHEST ALIGNMENT

0.741

Navigating Diverging Perspectives: Reasoning, Evidence, and Decision-Making in Drug Safety

0.727

Summarising the Evidence for Drug Safety: Meta-Analysis Approaches

0.716

READUS-PV: Explanation and Elaboration

All pharmacovigilance methodology: decision frameworks, meta-analysis, reporting standards.

LOWEST ALIGNMENT

0.094

LLM Performance & Reproducibility in Named Entity Recognition

0.124

Adverse Effects After HPV Vaccination — Japan

0.158

Narrative Search Engine with AI Query Suggestions

Two on AI/ML methods, one on vaccine safety with narrow, specific vocabulary.

WHAT THE FLAT TREND WAS HIDING

Stable alignment

$\neq$

Stable thematic composition

EXAMPLE: Topic 4 — AI / ML

CONCLUSIONS

01

Overall alignment is moderate and **stable over time**

02

Pharmacovigilance-related topics show the strongest alignment

03

Thematic composition **changes** despite a stable aggregate score

The background is a light blue gradient. In the top-left corner, there are several thin, overlapping wavy lines in a slightly darker blue. In the top-right corner, there is a pattern of small blue dots arranged in a grid-like fashion, with some dots missing to create a sparse effect. In the bottom-left corner, there is another pattern of small blue dots, similar to the one in the top-right but with a different arrangement. In the bottom-right corner, there are more thin, overlapping wavy lines, similar to the ones in the top-left.

THANK YOU
